

PHASE II: SUPPLIER PAYMENT AND DELIVERY MONITORING SYSTEM

Project Title: Supplier Payment and Delivery Monitoring System

Introduction

This phase models the Supplier Payment and Delivery lifecycle, which is essential for defining the Management Information System (MIS) foundation of the project. We use a process diagram with swim-lanes to visualize how the core roles (Procurement, Supplier, Finance) interact with the automated Monitoring System. This ensures clarity in system requirements and role responsibilities.

Explaining the Diagram step by step

The process is divided into four main swim-lanes, representing the key actors and the automated system:

- **Procurement Officer:** Initiates the cycle by creating and issuing a Purchase Order (Order Placement) to a supplier.
- **Supplier:** Fulfills the order by completing the Delivery of goods, which triggers the system's recording process.
- **Finance Officer:** Validates the delivery records, checks against the invoice, and Processes Payment to the supplier.
- **Monitoring System:** The PL/SQL core, which handles automation:
 - Records the delivery date and expected payment schedule.

- Monitors & Alerts by automatically flagging delayed deliveries or overdue payments using triggers.
- Generates necessary **Reports** (e.g., supplier performance) for management review.

Why This Process is Useful for MIS

This model supports the MIS by transforming manual tracking into proactive, automated monitoring.

MIS Functions:

- Automates data validation and exception handling.
- Provides real-time alerts for delays and overdue payments.
- Tracks supplier performance via predefined KPIs.

Organizational Impact:

- Reduces manual errors in reconciliation.
- Improves supplier accountability by transparently flagging performance issues
- Enhances financial planning and transparency.

Analytics Opportunities:

- Trend analysis of supplier delivery performance
- Forecasting payment schedules and cash flow
- Identifying frequently delayed suppliers for contract reviews

Conclusion

The model clearly defines the steps for the **Supplier Payment and Delivery Monitoring System**. By assigning core business logic (like monitoring and alerts) to the **Monitoring System** swim-lane, it directly guides the development of complex PL/SQL objects (Phase VI and VII) that automate critical operations and ensure efficiency and accountability.
