Project Title: Supplier Payment and Delivery Monitoring System

Supplier Payment and Delivery Monitoring System

1. Project Overview

The Supplier Payment and Delivery Monitoring System is a PL/SQL-based business solution designed to automate the tracking of supplier deliveries and payment transactions. It helps businesses monitor supplier performance by storing details about deliveries, expected delivery dates, and payment schedules. Using PL/SQL triggers, procedures, and functions, the system automatically detects and flags delayed deliveries or overdue payments, ensuring efficiency, transparency, and accountability in supplier management.

2. Innovation and Benefits

This project improves business operations by integrating automation and real-time database logic. Unlike manual tracking systems, this one automatically alerts users when deadlines are missed or payments are overdue. Through intelligent PL/SQL procedures, it enhances supplier accountability, provides instant updates, and supports better financial decision-making.

3. PL/SQL Components

- Procedure: Inserts and validates supplier payment records.
- Trigger: Updates delivery and payment status automatically when deadlines are missed.
- Function: Calculates total pending payments for each supplier.
- Exception Handling: Prevents invalid supplier IDs or incorrect data entry.
- Cursor: Generates supplier performance reports monthly.

4. Database Schema
